Polaris ID

Open-source (Apache-2.0) verification of digital identity credentials.

PRE-PILOT, ON NOTIONAL DATA

TIGERLAUNCH 2026-27

A verifier that wrongly says yes looks exactly like one that works.

Identity wallets are arriving. Every service that accepts one must trust a verifier to say no: to a forged signature, a wrong issuer, a replayed request.

A demo shows what a verifier accepts.

Polaris ID: open-source (Apache-2.0) verification of digital identity credentials, with the evidence of what it refuses published.

33 refusal test vectors, each citing the clause or named policy it rests on, plus 3 controls (version 0.3.1).

PRE-PILOT, ON NOTIONAL DATA

The EU dates.

About 24 Dec 2026

Member states must provide wallets.

About 24 Dec 2027

Private services, other than micro and small enterprises, that must use strong user authentication accept them at the user's request (Art. 5f(2), Regulation (EU) 2024/1183).

Facts only.

> polaris-oid4vp 1.0.0rc7 is OpenID Certified to the OpenID4VP 1.0 + HAIP 1.0 Verifier profile (sd_jwt_vc, direct_post.jwt). That package version, in that role; not all of Polaris.

- polaris-oid4vp tested against 15 implementations others wrote (7 wallets, 8 libraries and tools).
- vouchkit's CI runs 20 of our vectors (vouchkit/vouchkit#17, merged 28 Oct 2026).
- authlete/sd-jwt merged our fix (#18, 31 Oct 2026) and released it in 1.11.
- Outside CI (IDFoundry/OID4VCgo) runs polaris-oid4vp daily since 11 Oct 2026.
- web-token/jwt-framework's tests run 17 of our vectors (PR 749, merged 31 Oct 2026).
- OpenSSF Best Practices silver badge.

HYPOTHESIS

Relying parties that accept EU wallets depend on verifiers that refuse bad credentials correctly.

Polaris supplies the open refusal evidence (the vectors) and a verifier package, polaris-oid4vp (1.1.0 on PyPI since 30 Oct 2026; its 1.0.0rc7 release is the OpenID Certified one).

Three outside projects already run vectors from the set in their own tests. Whether relying parties pay for a refusal-evidence run is what we test next.

Open core.

The open verifier is free.

Paid operations for relying parties (hosting, monitoring, support).

HYPOTHESIS

COMPETITORS AND NEIGHBOURS

EU reference verifier	Member-state wallet kits	IdP and KYC vendors	In-house builds

Polaris complements them.

It publishes refusal vectors anyone can run. The EU reference verifier merged our fix (#634, 15 Oct 2026). Three outside projects run vectors from the set against their own verifiers: OID4VCgo, vouchkit and web-token/jwt-framework.

Defensibility is a public record anyone can check.

A mechanism counts as done only when a test fails without it.

THE ASK AND ITS USE

The prize money (non-dilutive) goes first to an independent security review.

Then a public test verifier, hardware signing keys, and a bounty pool for verified outside findings.

ALSO ASKED FOR

An introduction to one EU relying party for a pilot on test data.
